

download -> have to make
PAPER effective brief

I have a rather clear idea about what a database is, broadly speaking at least :
structured data, unique and foreign keys, data query language.

Nevertheless, I've recently heard about "Data Warehouse", which is presented to be
the logical result of the companies' daily data processing.

But what is it exactly ? For example what is an operational database ? What about data
mining ? (The French translate it by fouilles de données).

I also have some other questions :

- To get interested in those concepts, do I need specific and expensive software ?

Or can I deal with the same concepts in a very basic way with MySQL or even Excel ?
